

IVAN HENRIQUES

I am a transdisciplinary artist and researcher working in multimedia installations examining different perceptions of time, memory and environment. In my works I explore hybrids of nature and (technological) culture creating new forms of communication between humans and other living organisms, considering nature as inspiration and a necessary factor in the development of the technological world. I research in various aspects of real time environment data visualization, where it becomes a motive and motor for the platform that I creates within my works. In a deep look at this information from the environment and other living organisms, I create interactive and participatory art installations. This visionary combination of robotics and living organisms explores the fluidity of subject positions in the post-digital world. The audience involvement is the core of the creation, approaching all the living species to have a unique experience envisioning a new possible world where we all are hypersensitive to our surroundings. The development of smell, touch and audiovisual installations explores such concepts [1] as: the future (reinvention) of the environment; the acceleration of techno-scientific mutations; when nature becomes culture; the use of natural resources; where these hybrids of nature and technology will take place in the near future and reshape and redefine our tools to be more coherent with the world we live in. [1]: these concepts were discussed in the e-book Oritur".
